

INVESTMENT SUMMARY: Mimir Labs

Business Summary: Mimir Labs develops a pre-execution data layer that makes enterprise data and process behavior deterministic before integration, governance, or ERP configuration begins. The company serves mid-market manufacturing and distribution organizations with complex, multi-system environments. By resolving semantic conflicts and enforcing canonical data behavior upstream, Mimir reduces implementation failure risk, shortens time-to-value, and lowers integration and compliance costs. Revenue is generated through diagnostic engagements, pilot deployments, and subscription-based enforcement infrastructure.

The Problem: Enterprise systems assume that business data and processes are internally consistent. In reality, organizations operate across fragmented systems with conflicting definitions, duplicated entities, and undocumented workflows. These inconsistencies remain latent until transformation initiatives begin (ERP migrations, integrations, compliance audits), at which point they surface as scope creep, rework, delays, and cost overruns. Traditional governance and integration tools operate downstream and cannot resolve the underlying semantic inconsistencies driving these failures

Target Customer: Primary: Mid-market manufacturers (40–250 employees, \$15M–\$75M revenue) with legacy ERP systems, heavy Excel reliance, and upcoming compliance or ERP initiatives. Secondary: Integration-led organizations and data/governance teams experiencing persistent reconciliation issues and reporting inconsistencies. Economic buyer: CIO, COO, or Head of IT/Operations. End users: Data engineers, ERP implementation teams, and compliance stakeholders.

Solution / Product: Mimir Labs delivers a staged architecture that resolves enterprise data behavior before execution:

- Ratatosk: Short diagnostic engagement that discovers and formalizes the true semantic structure of enterprise data environments.
- Jormungandr: Enforcement layer that validates data contracts and prevents governance violations.
- Bifrost: Synchronization layer ensuring governed data movement across systems.
- Ragnarok: Migration framework that transitions systems into a known canonical structure.
- Yggdrasil ERP: Long-term governance-native operational platform.

The system operates as a flow: detect → reconcile → enforce → propagate. Governance is enforced at the system boundary rather than retroactively, ensuring downstream systems operate on validated data.

Value Proposition:

- Reduces ERP implementation risk by resolving structural conflicts before configuration
- Eliminates manual reconciliation and shadow system dependency
- Shortens integration timelines and reduces failure rates
- Enables deterministic auditability for compliance environments Customers pay for risk reduction, speed, and operational clarity.

Intellectual Property:

- Proprietary semantic extraction and canonical modeling methodology

- Deterministic schema interpretation and mapping engine
- Structured governance manifest format and enforcement logic
- Trade-secret architecture spanning discovery, enforcement, and synchronization layers Barrier to entry is driven by accumulated semantic models, workflow artifacts, and system-level integration patterns.

Competition:

- Data governance platforms (policy enforcement)
- Integration platforms (data movement)
- Data observability tools (quality monitoring)
- ERP vendors (operational systems) These solutions operate downstream of the core problem and assume semantic consistency rather than establishing it.

Competitive Advantage:

- First-mover positioning in pre-execution semantic resolution
- Addresses root cause of implementation failure rather than symptoms
- Land-and-expand model starting with low-friction diagnostic
- Increasing switching cost as customers adopt enforcement and synchronization layers
- Alignment with compliance-driven buying triggers (auditability, traceability)

Market Opportunity: TAM: Global ERP, integration, and data governance markets (> \$200B combined) SAM: Mid-market manufacturing and distribution with complex system landscapes SOM: Initial wedge targeting compliance-exposed manufacturers pursuing ERP upgrades or audits Entry is driven by immediate, high-cost pain tied to implementation failure and compliance risk.

Revenue Model:

- Ratatosk diagnostic engagements: \$8K-\$25K
- Jormungandr enforcement subscription: \$20K-\$120K annually
- Migration and implementation support: \$50K-\$300K
- Long-term platform subscriptions (Yggdrasil) Model converts low-friction diagnostics into recurring infrastructure revenue.

Marketing Strategy:

- Targeted outreach to organizations showing signals of ERP migration, compliance pressure, or integration failure
- Thought leadership focused on ERP failure modes and semantic inconsistency
- Direct engagement with technical and executive stakeholders via LinkedIn and curated prospect lists

Sales Strategy:

- Initial diagnostic engagement (low commitment, high insight)
- Follow-on pilot (compliance or integration-focused)
- Expansion into enforcement and synchronization layers

- Long-term platform adoption or system replacement Sales motion prioritizes conversion from insight → pilot → infrastructure.

Ask & Use of Funds: BF Funding Ask: \ \$250,000 Use of funds:

- Engineering: harden Ratatosk automation and Jormungandr enforcement core
- Go-to-market: SDR/outreach infrastructure and pilot acquisition
- Deployment: repeatable installation and pilot execution capability Objective: secure 2–3 paid pilots and establish repeatable conversion motion.

Team: Christopher Gaither, Founder/CEO

- ~15 years experience in manufacturing, quality, and supply chain systems
- Deep domain knowledge of ERP failure modes and operational data structures
- Sole architect of platform and methodology

Economic Development: Mimir Labs will maintain headquarters in Pennsylvania, with plans to build a technical and operational team focused on enterprise software deployment and support. Over 5 years, the company expects to create engineering, sales, and implementation roles aligned with regional manufacturing and technology ecosystems.

Long Term Business Strategy: Mimir Labs will scale as a core infrastructure provider for enterprise data environments. Exit options include strategic acquisition by integration, governance, or ERP platforms, or continued growth as an independent infrastructure layer.
