73 of 73

Key Indicators

82%	Definition Consistency
67%	Ownership Clarity
SUGGESTED: Developing	Governance Maturity
57%	Migration Readiness
0%	Schema Completeness (NOT NULL %)

Summary

A total of 73 data fields across 18 tables from 7 source system(s) were assessed during this workshop session. Of these, 73 fields (100.0%) have been assigned explicit business definitions.

The review identified 12 label collision(s) and 1 name collision(s). These represent cases where the same business term was applied to multiple fields, or where the same technical field name received different business definitions. Clarifying these definitions will improve data governance consistency.

6 of 18 tables (33%) have not been assigned to a taxonomy group (domain owner). Assigning a taxonomy group to each table establishes clear departmental accountability for the data it contains.

Based on the coverage score and consistency metrics, the current governance posture is classified as "SUGGESTED: Developing". This classification is determined by rule-based thresholds applied to the declared annotation data and does not represent a predictive assessment.

The source schema contains 13 foreign key relationship(s) across 11 table(s), with 2 orphan table(s) having no inbound or outbound foreign keys. Average table width is 4.1 columns, with the largest table ("mes_jobs") containing 6 columns.

Remediation Outlook

78% (SUGGESTED: Good) Governance Score

The action plan identifies 10 remediation item(s): 7 critical, 1 high-priority, 0 consolidation, and 2 migration-prep. Completing all items is projected to improve coverage by 0.0 percentage points. See [action_plan.pdf](#) for full details.

2 operational risk(s) identified (1 critical, 1 high) including potential impacts to order accuracy, financial reconciliation, and data integrity.
