

Evangelist / Translator Brief

Yggdrasil ERP – Pre-Release Validation Phase

Purpose of This Role

Your job is **not to sell a product**.

Your job is to **place an idea** in the right rooms and observe what happens.

Yggdrasil ERP is an infrastructure-layer system built around a non-negotiable constraint:

data must be sanitized, standardized, and semantically valid before it is allowed to exist in the system.

This is not a mainstream posture. That is intentional.

What This Is

- A **deterministic data-handling architecture**, not a customizable application
 - A **foundation layer** for manufacturing, quality, and supply-chain systems
 - A system where **useful data becomes part of the ecosystem**, not a customer-specific customization
 - A product that assumes **truth is enforced at ingress**, not reconciled later
-

What This Is NOT

You must be explicit about this:

- ❌ Not a traditional ERP
- ❌ Not configurable per customer
- ❌ Not a workflow tool
- ❌ Not an AI product pitch
- ❌ Not looking for broad adoption or hype
- ❌ Not competing on features or dashboards

If someone asks for customization, the answer is:

“Then this isn’t for you.”

Your Actual Task

You are acting as a **translator and filter**, not a closer.

Your responsibilities:

- Quietly introduce the concept to **systems-literate people**
- Share the core memo or explanation **without embellishment**
- Observe reactions, questions, and points of friction

- Identify:
 - who immediately understands the constraint
 - who misunderstands it
 - who rejects it for incentive reasons (this is valuable signal)

You are not expected to:

- defend the system
 - argue with skeptics
 - convince buyers
 - chase follow-ups
-

Who to Talk To

Focus on people who:

- have lived with ERP/QMS/SCM failures
- understand compliance, quality, or infrastructure
- are no longer compensated for customization work
- have long memory and low ego

Avoid:

- VCs
 - CROs
 - SaaS sales orgs
 - Systems integrators
 - Anyone whose business depends on tailoring software per customer
-

How to Introduce It (Tone Guidance)

Use language like:

- “I ran into an architecture that makes a hard tradeoff most systems avoid.”
- “This assumes most flexibility is actually a liability.”
- “It’s intentionally boring and opinionated.”

Do **not** use:

- “disruptive”
- “revolutionary”
- “AI-powered”
- “next-generation”

Understatement is a feature.

What Success Looks Like (Early Phase)

Success is **not** revenue.

Success signals include:

- “This reminds me of a problem we never solved.”
- “I don’t know who would buy this, but I get why it exists.”
- “Someone should look at this more closely.”
- Quiet forwarding without commentary

Silence is neutral.

Strong rejection is informative.

Immediate enthusiasm is rare and suspicious.

Compensation & Structure (Pre-Release)

- Sweat equity participation
- Eligibility for:
 - **15% of implementation costs** you originate
 - **3% of ARR** you generate, capped at **18 months**
- No quotas
- No exclusivity
- No obligation to continue if it doesn’t resonate

This role exists because **the builder should not be the evangelist** at this stage.

Final Guiding Principle

If you ever feel like you are *selling*, stop.

Your job is to let the idea stand on its own and see
who recognizes the shape of the problem without being persuaded.
