

# CAIP-HE Reference Framework

*A platform-agnostic reference framework for ERP+AI – Not a product*

## THE CHALLENGE

Organizations across industries have invested heavily in ERP modernization, analytics, and AI. Yet many continue to struggle to translate insight into coordinated, enterprise-wide action.

The issue is not the absence of technology. It is the absence of a shared structural framework that explains how analytics, automation, integration, and personalization must work together to enable intelligent decision-making within complex ERP environments.

The core challenge is structural, not technical: organizations lack a coherent model for how intelligence should flow from insight --> decision --> execution at the enterprise level.

## INDUSTRY SIGNALS

## THE CAIP-HE FRAMEWORK

CAIP-HE defines the capability conditions required for intelligent ERP, independent of industry or vendor.

CAIP-HE is a **platform-agnostic reference framework** that explains how ERP systems can evolve from transactional systems of record into intelligent, decision-enabling systems.

CAIP-HE stands for:

- **Cognitive Automation**
- **Advanced Analytics**
- **Integration & Interoperability**
- **Personalization**

Enterprise intelligence emerges **only when all four operate together**.

# CAIP-HE Reference Framework

*A platform-agnostic reference framework for ERP+AI – Not a product*

## CAIP-HE AT A GLANCE

## WHAT EACH PILLAR ENABLES (*Not How to Implement*)

- **Advanced Analytics**  
Enables predictive and prescriptive insight that informs decisions, not just retrospective reporting.
- **Cognitive Automation**  
Enables decisions and actions to be carried out consistently through intelligent workflows and orchestration.
- **Integration & Interoperability**  
Enables intelligence to travel across ERP, CRM, HCM, SIS, LMS, and external systems rather than remaining siloed.
- **Personalization**  
Enables role-aware, context-sensitive delivery of insight aligned to decision authority.
- No single pillar is sufficient on its own.

## HOW ORGANIZATIONS USE THIS FRAMEWORK

Organizations do not 'implement' CAIP-HE like software. They use it as a conceptual and evaluative lens to:

- Assess ERP modernization and AI initiatives
- Structure enterprise strategy discussions
- Diagnose why intelligence fails to translate into action
- Inform roadmap and governance discussions
- Compare ERP platforms and architectural approaches

This reflects conceptual use and professional evaluation, not product adoption.

## SCOPE AND POSITIONING

- **Reference framework, not a product**
- **Cross-industry** (originated in higher education; applicable across sectors)
- **Platform-agnostic** across major ERP ecosystems
- **Conceptual and structural**, not prescriptive or vendor-specific

## WHY THIS MATTERS

CAIP-HE provides a shared structure for reasoning about intelligent ERP systems. Its value lies in how it shapes evaluation, design, and decision-making, not in deployment.
